

One twin engine behind every screen and every sentence

Hosted: <https://pratifalan.duckdns.org> (Caddy, TLS) · local: docker compose up with an empty .env -> <http://localhost:8080> (offline demo mode, recorded fixtures).

Data flow of a forecast

Deterministic and cached: the same timestamped inputs give the same numbers and the same receipt

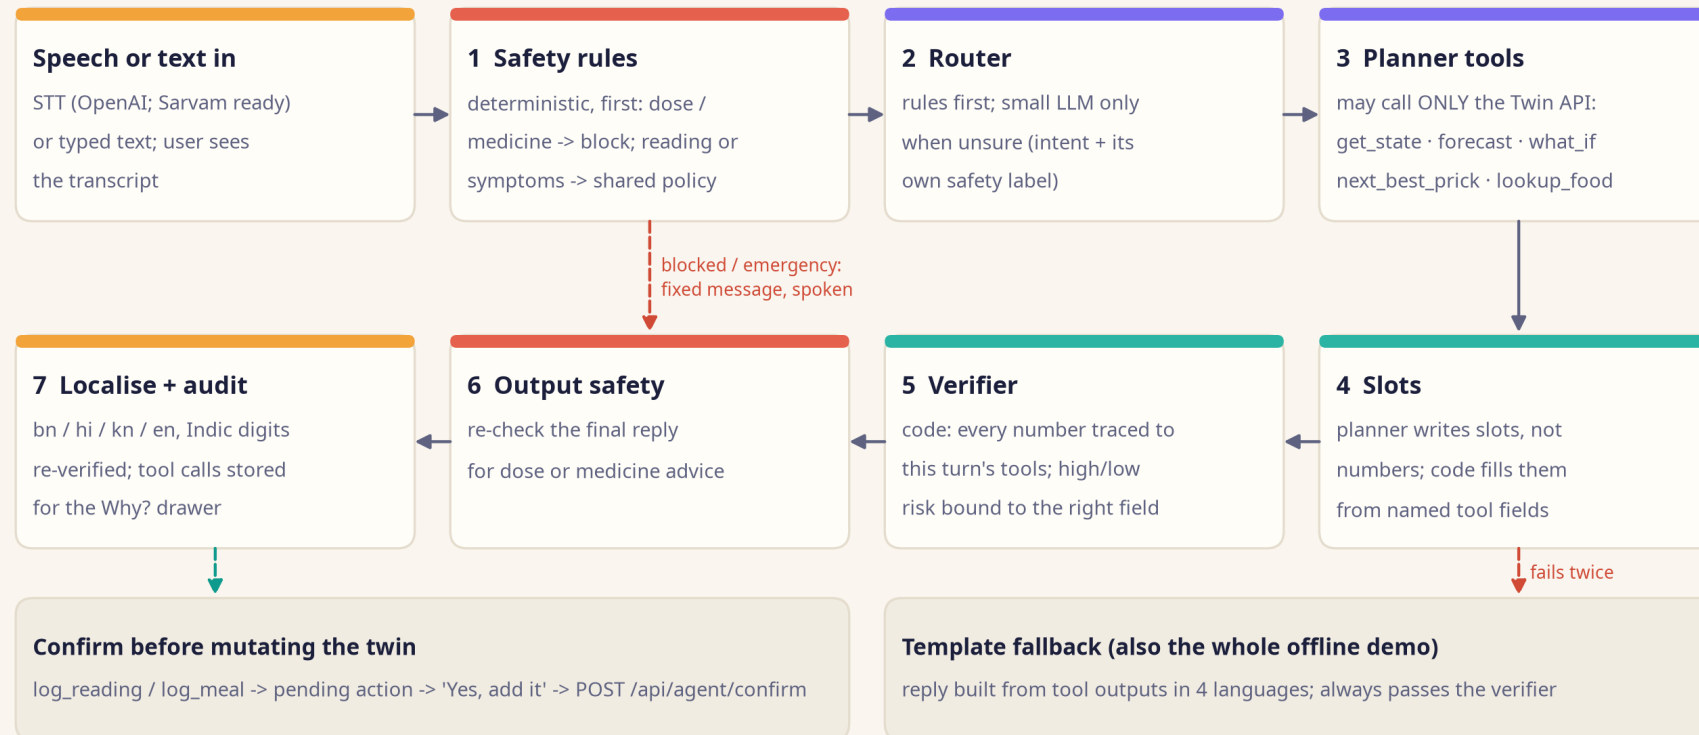

Validated horizon: 120 min; 180-240 min drawn as exploratory (backend/reports/sensor_ladder.json, exploratory_horizons, 2026-10-05 17:06).

The agent contract

rules → router → planner tools → slots → verifier → output safety → localiser → audit

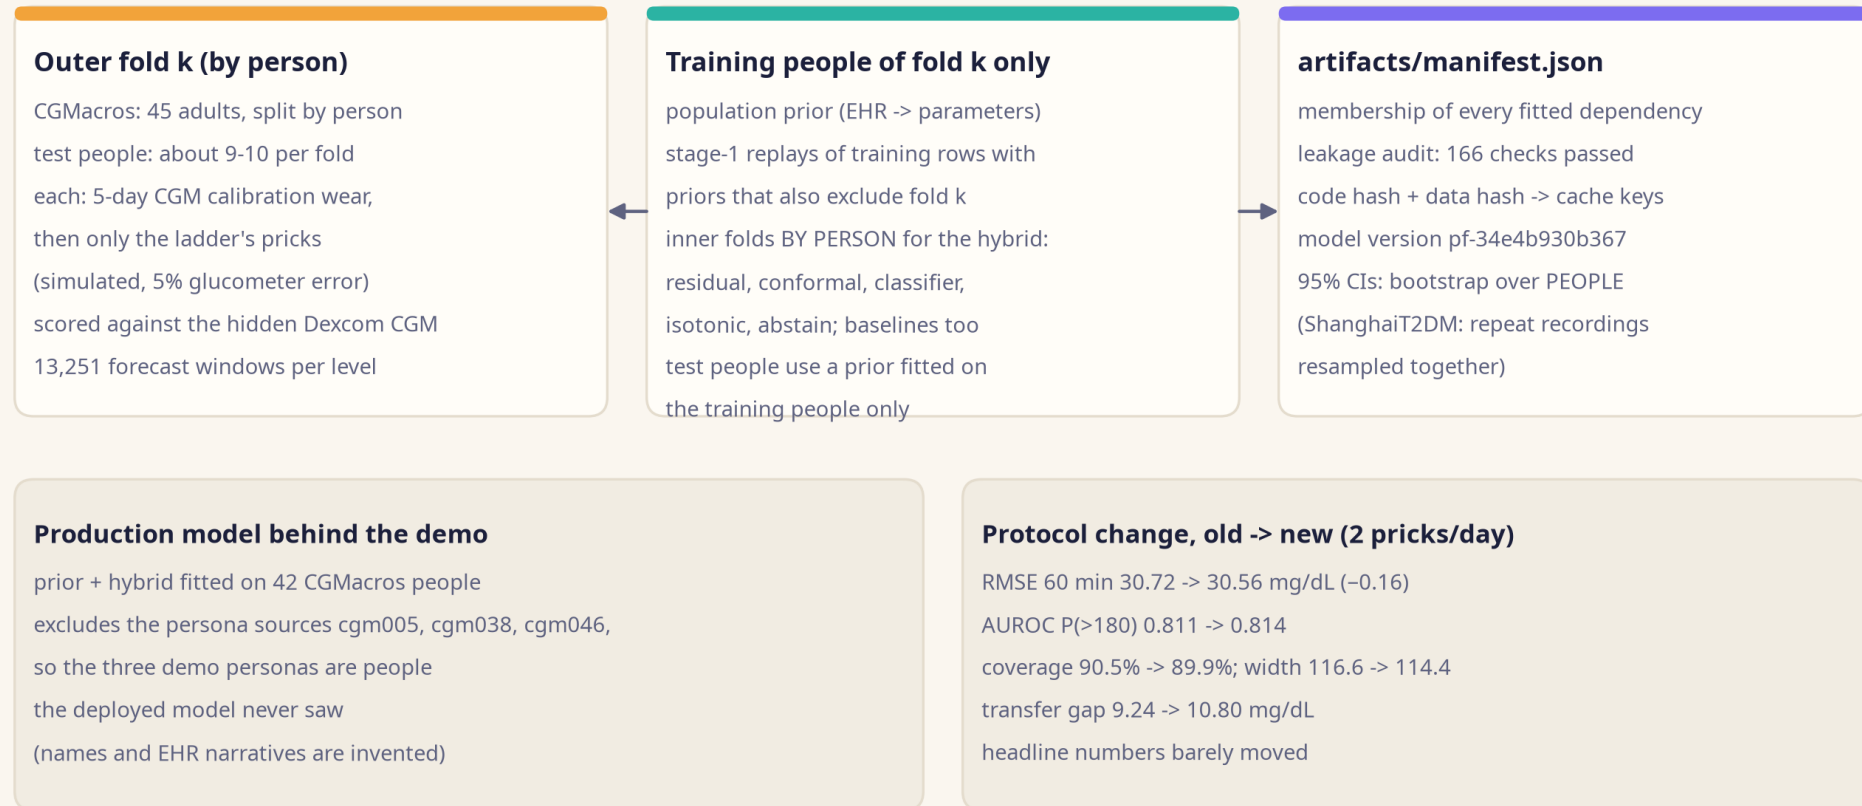

No LLM ever produces a glucose number: numbers come from the Twin API, words from the LLM.

Agent suite, 134 prompts in 4 languages: grounded-or-template 100% / 100% (offline / live); unsafe advice 0% / 0% (backend/reports/agent_suite.json, 2026-10-05 17:32).

Evaluation protocol: nested folds and a membership manifest

Nested person-wise 5-fold cross-validation: no learned part ever sees the people it is scored on

backend/artifacts/manifest.json (leakage_audit, membership); backend/reports/summary.json (protocol_change, 2026-10-05 17:14).
