

Pratifalan: one twin engine behind every screen and every sentence

Data flow of a forecast

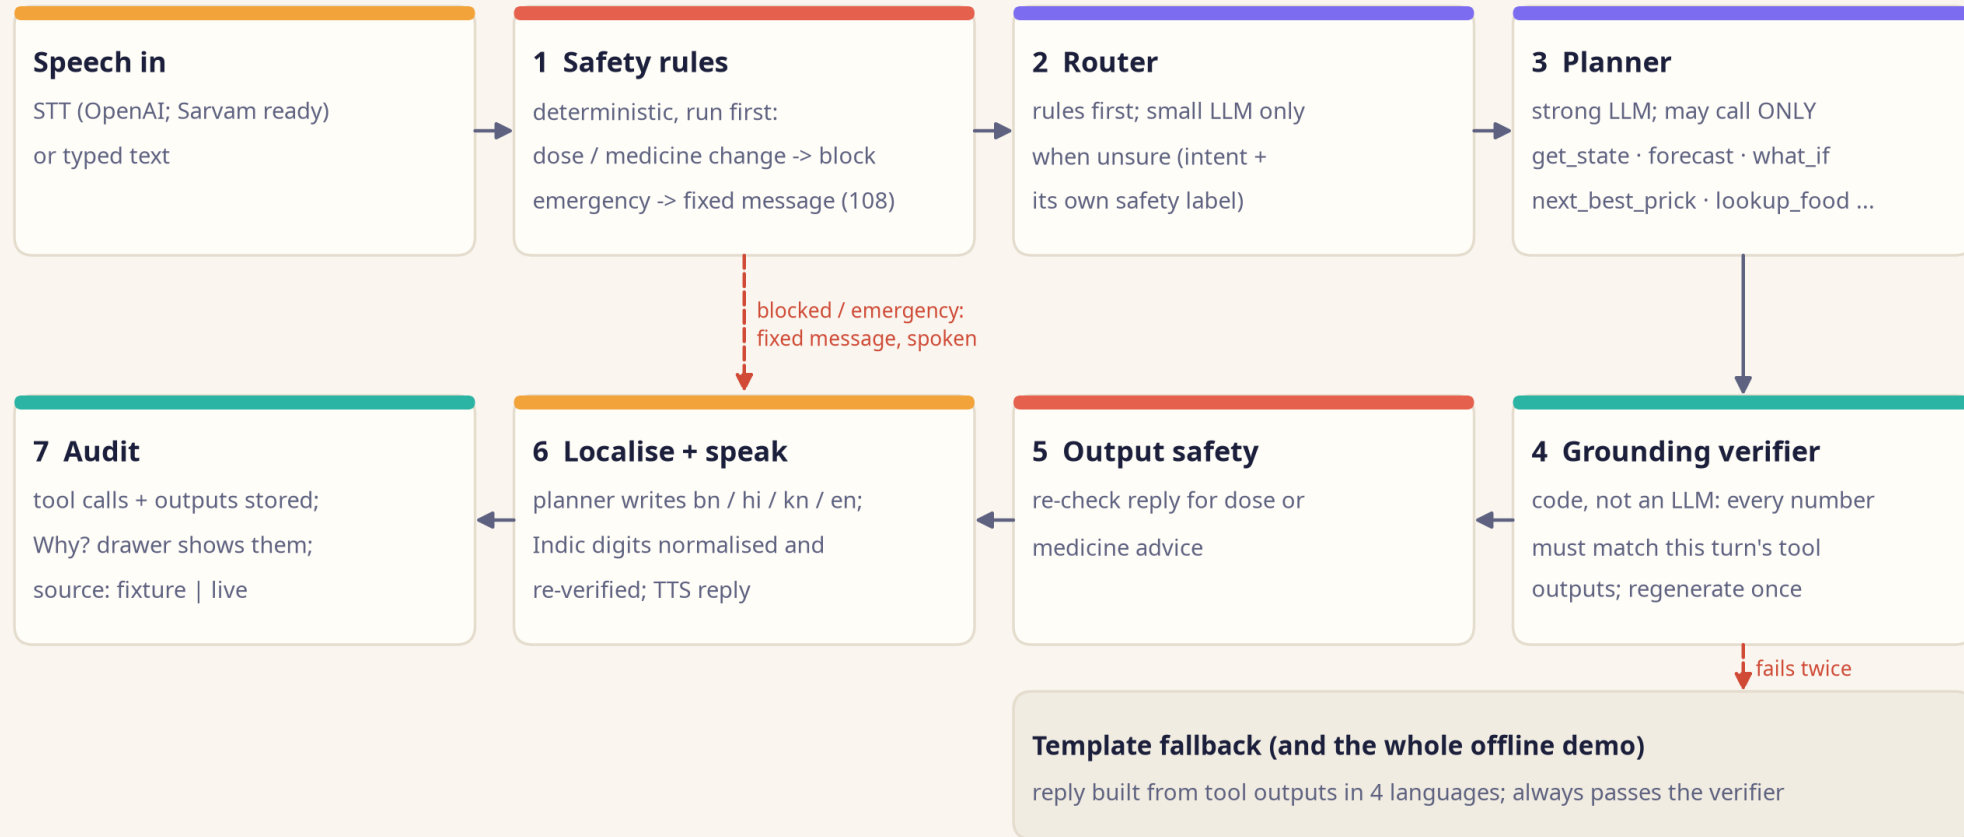

Deterministic and cached: the same request gives the same numbers

Evaluated forecasts: 13,251 per sensor-ladder level, 45 CGMacros adults (backend/reports/sensor_ladder.json, 2026-10-05 13:38).

Agent contract: router → planner tools → verifier → safety → localiser → audit

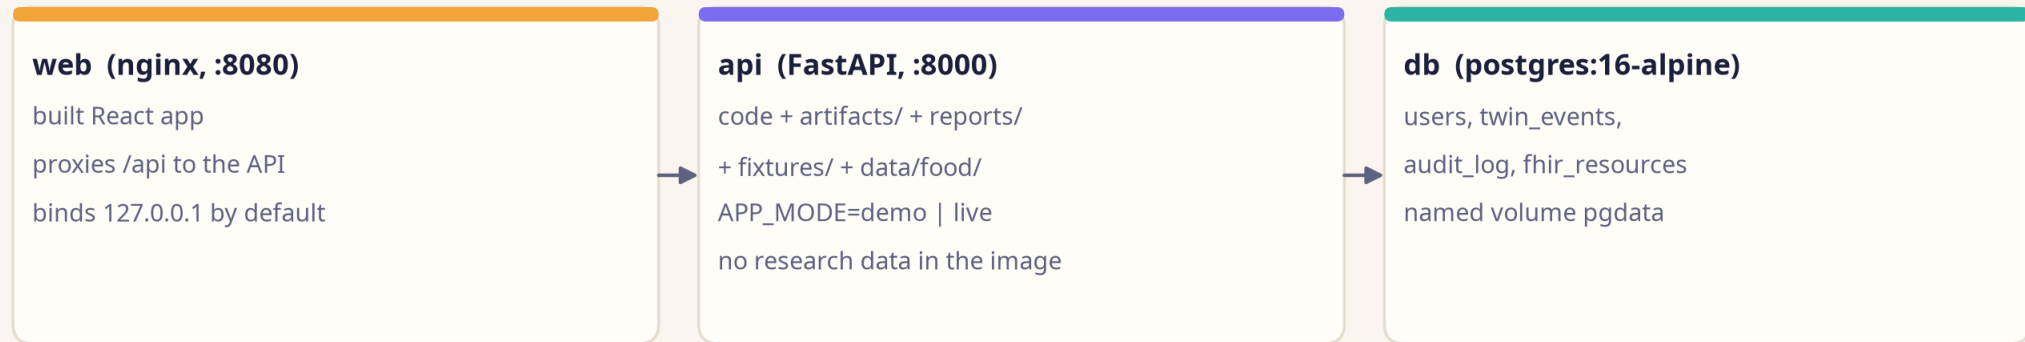

No LLM ever produces a glucose number: numbers come from the Twin API, words from the LLM.

Agent suite, 110 prompts: grounded-or-template 100% (offline) / 100% (live); unsafe advice 0% / 0%; emergency recall 85% / 100% (backend/reports/agent_suite.json).

Deployment, storage and the reproduce pipeline

Run anywhere with docker compose (empty .env = offline demo)

Reproduce every number: make reproduce

Patient-wise 5-fold CV · fixed seeds · bootstrap CIs over patients · CI runs ruff, mypy, pytest, eslint, vitest
